Mind *and* Society

A Peer Reviewd Research Journal
in Humanities and Social Sciences

Disclaimer :

The views expressed by the authors in their research papers are their own. 'Mind and Society' and its publisher /Editor/printer do not take any responsibility for any injury and/or damage to person or property caused by the article. Author will be solely responsible for the issues related to intellectual property, copy right and plagiarism. All the disputes related to 'Mind and Society' will come under the jurisdiction of Rajnandgaon(C.G.) court only.

Guideline to Author

Every submission should adhere to the journal format and style, legibly written in good English/Hindi, comprehensive, concise and complete. It is essential that author(s) should prepare the manuscript according to journal's instructions. Failure to follow them may result in papers being delayed or rejected. Therefore, contributors are strongly encouraged to read these instructions carefully before preparing a manuscript for submission and the manuscripts should be checked carefully for grammatical errors too.

All manuscripts for publication will be considered on their individual merits. The manuscripts will be subjected to "peer review". The manuscripts will be sent to reviewers/referees and their comments along with the editorial board's decision will be forwarded to the corresponding author for necessary action. The final decision to accept an article rests with Editor-in-Chief who reserve the right to make alterations in manuscripts. Prior and duplicate publications are not allowed. Manuscript(s) must be accompanied with a statement (Membership Form) that it has not been published elsewhere and that it has not been submitted simultaneously for publication elsewhere. Authors are required to sign an agreement transferring the copyright to the publisher. All accepted manuscripts,   and photographs become the property of the publisher.

Instructions for Preparation and Corresponding Research Article:

1. All parts of the manuscript should be typewritten, 1.5 space, with margins of at least one inch on all sides .

2. The manuscript should be on A4 size. Page numbers should be given accordingly.

3. Each article should be summarized in an abstract of not more than 200 words and avoid abbrevia tions, diagrams, and reference to the text.

4. The manuscript should be prepared in MS Word in Times New Roman font for articles in English using a font size of 12.

5. For Hindi articles, prepare manuscript in MS Word in Kruti Dev-10 font using a font size of 14.

6. Reference should be in accordance with APA style.

7. Name, post, complete address, Email address, and contact no. should be mentioned below the article.

8. The complete paper to be mailed on mindandsociety99@gmail.com or drbsonber@gmail.com.

9. Membership fee must be paid by a DD named MANAV NAVNIRMAN SANSTHAN RAJNANDGAON (paid to SBI Goshalapara branch, Rajnandgaon, branch code SBIN-0030400)

10. Two Hard copy of the paper, one soft copy in CD , membership form, certification of originality must be send to the editorial address.

11. The Journal also can be subscribed online on 'www.mindandsociety.in' .

Alcoholism in Chhattisgarh: A breaker of development

Alcohol is being used as common drink in so-called modern human society to enjoy any occasion and it is the one of most commonly abused substance. Alcoholism has various adverse and harmful consequences to the individual, family as well as society. Empirical evidences show a causal relationship between more than 60 types of diseases and alcohol. Some of the consequences of alcohol abuse are interpersonal violence with partner, violence in family and society, road traffic accident, financial source depletion, excessive burden on health cost, employment's problem etc. In addition alcoholism leads to significant impairment in attention, executive functions, visuo-constructive ability and verbal-visual learning and memory. This problem is more critical in some specific areas like Chhattisgarh. Addressing and discussing above critical aspects of behaviour and cognitive function may be useful to conduct awareness programs about problems of alcoholism in turn to enhance well-being of people as they can participate in the process of development with their maximum capacity.

Human being is suffering worldwide from over and uncontrolled consumption of different kind of substances. Alcohol is one of most common substances being used for various causes. It is well known for us that, nearly all the medicines and many packaged drink/foods contain a limited alcohol base. Can say that, perhaps no one on the earth without taking alcohol in any form, but ones breaks the natural limit it is considered as abuse.

Alcohol abuse is a critical national issue, but it is more serious in Chhattisgarh state. State-wise details of a survey regarding drug abuse were made public by the Social Justice Ministry. The data shows a high proportion of children have reported alcohol use. Dr Atul Ambekar, Head of AIIMS National Drug Dependence Treatment Centre have said that, this is highly worrying trend and immediately needs intervention by social workers, NGOs and government. He also added that more than half of the male population of Chhattisgarh, Tripura and Punjab are uses alcohol.

A report was published by Aditi Tandon, 2019 through www.tribuneindia.com, in which it is mentioned that Researchers have found a considerable variation regarding prevalence of alcohol abuse in the country and the states with high prevalence of alcohol use are Chhattisgarh (35.6 per cent), Tripura (34.7 per cent) and Punjab (28.5 per cent) in comparison to India's average of 14.6 per cent. Bigger details of this report disclose that Indians are intensive drinkers which are evident from the choice of drink and high concentration products preferred over low ones as well as from the quantity of alcohol consumed during a single occasion. Approximately

half (43 per cent) of alcohol users consume more than four drinks all through a single occasion, which indicates heavy episodic drinking. High proportion of alcohol abusers experience problems like getting involved in physical clash after drinking (26.8 per cent), day time uses of alcohol (21.2 per cent) and drunken road accidents (4.1 per cent) the survey findings show. A report of National Crime Record Bureau (NCRB) shows that alcoholism plays a major role in 70 to 85 per cent of offences against women.

Although no empirical studies are available, but increasing incidence of alcoholism in the villages of Chhattisgarh stems from the far-too-easy, 24x7 availability of liquor. This is because of the Kochia (the sales agents appointed in villages by liquor contractors) who illegally stock and trade liquor all the day and night. It is very common to see comparably a big crowd before any shop of alcohol and a long queue of people selling and drinking Desi alcohol like Salfi and Mahua in daily local markets.

This editorial discussion is an attempt to focus of attention towards one of the major issues of Chhattisgarh, especially tribal society like unstoppable consumption of Salfi (a type of alcohol get by a specific type of tree) and alcohol made by rice/mahua. Tribal people both male/female are increasingly involved in this anti-welfare act on the cost of their food items, forest products, vegetable, wages, etc. Hope, this discussion will draw the attention of researchers, social workers, NGO's and policy makers of Government towards such a critical issue of alcoholism which considerably affects individuals wellbeing and put a break in the development of family, community, state as well as nation.

Mood States of Tension Headaches Patients and Normal Respondents

* Awadhesh Kumar Maurya

Tension headache is the most common in headaches experienced by general population. It may leads serious mood related issues.The present study, was constructed to investigate tension headache patients and normal respondents on mood states. For this study shall consists 60 participants (30 tension headache patients and 30 normal respondents) belonging to 20- 45 years of age group will be selected on the recommendation of medical practitioner. They were sampled by following purposive sampling procedure..Eight State Questionnaire (8SQ) (M. Kapoor and M. Bhargwa, 1990)were used to collect the data. Appropriate statistical methods were used to analyzing raw data. Results shows significant difference between Tension headache patientsand control group on anxiety and arousal but not found significantdifference on other mood states like depression, regression, fatigue or guilt feeling in both the group. Results are discussed below.

Key Words- Tension headaches,mood states.

Tension-type headache (TTH) is most common types of primary headaches (Khil L, Pfaffenrath V, Straube A, Evers S, Berger K., 2012). TTH, previously called muscle contraction headache and stress headache, is characterized by generalized pressure or tightness in the head. There is usually mild to moderate pain which is unaffected by activity. In general, TTH is not associated with nausea, vomiting, photophobia, and phono-phobia (Farooq K, Williams P., 2008) but it may affect one's mood in daily lives. Mood is defined as a consumer's affective state that is relatively global in nature, as opposed to emotions, which tend to have a specific cause (Gardner, 1985; Luomala &Laaksonen, 2000; Rusting, 1998). Within the field of mood research, a variety of moods are available for study. For example, in the context of negative moods, researchers have called attention to sad moods (Rusting &DeHart, 2000),

anxious moods (Thayer, Newman, & McClain, 1994), and angry moods (Rusting, 1998; Sedikides, 1995). Recently, consumer research scholars have compared positive and neutral moods (e.g., Barone et al., 2000; Lee &Sternthal, 1999; Meloy, 2000). However, the present study examines positive and negative moods, specifically, happy versus sad moods.

Recent research suggests that the role of negative moods is unclear in terms of when and why mood-congruent or mood-incongruent effects will occur (e.g., Rusting, 1998; Rusting &DeHart, 2000). Consequently, the study of happy and sad moods remains a topic of key concern to researchers (e.g., Larsen, McGraw, &Cacioppo, 2001; Park&Banaji, 2000; Wood, Michela, & Giordano, 2000). Thus, studying these mood states offers scope to contribute to the understanding of mood regulation, regarding the improvement of a sad mood to a happier mood

Assistant Professor, Department of Psychology, Shri Agrasen Mahila P. G. College, Azamgarh

state.Positive mood can be caused by many different aspects of life as well as have certain effects on people as a whole. Good mood is usually considered a state without an identified cause; people cannot pinpoint exactly why they are in a good mood. People seem to experience a positive mood when they have a clean slate, have had a good night sleep, and feel no sense of stress in their life. Positive mood has also been proven to show negative effects on cognition as well. According to the article "Positive mood is associated with implicit use of distraction", "There is also evidence that individual in positive moods show disrupted performance, at least when distracting information is present(Biss, Hasher &Thomas,2010(. Mood studies shows that tension is major cause of mood related problems. Tension headaches are the most common headaches in the general population; other names for them include muscle contraction headache, ordinary headache, Psychomyogenic headache, and stress headache. The International Headache Society(HIS) classifies tension headaches as either episodic or chronic; episodic tension headaches occur 15 or fewer times per month, whereas chronic tension headaches occur on 15 or more days per month over a period of six months or longer.

Tension headaches rarely last more than a few hours; 82% resolve in less than a day. The patient will usually describe the pain of a tension headache as mild to moderate in severity. The doctor will not find anything abnormal in the course of a general physical or neurological examination, although sore of tense area (trigger points) in the muscles of the patient's forehead, neck or upper shoulder area may be detected.Headaches are thought to be caused by changes in chemicals, nerves or blood vessels in the area. These changes send pain messages to the brain and bring on a headache.Headache is a pain in the head and neck region that may be either a disorder in its own right or a symptom of an underlying medical condition or disease. The medical term for

headache is cephalalgia. Headaches are one of the common and universal human ailments, described in the Bible as well as in medical writing from ancient Egypt, Babylonia, Greece, Rome, India and China. Severe chronic headaches were once treated by the oldest known surgical procedure, known as trepanning or trephining, in which the surgeon drilled a hole as large as 1-2 in diameter in the patient's skull without benefit of anesthesia. Evidence or trepanning has been found in skulls from Cro-Magnon people that are about 40,000 years old.Contemporary doctors divide headache into two large categories, primary and secondary, according to guidelines established by the IHSin 1988 and revised for republication in 2004. Primary headaches are those that are caused by an underlying medical condition. There are three types of primary headaches: migraine, cluster, and tension headaches. More than 90% of all headaches are primary headaches. Secondary headaches are caused by disease of medical condition; they account for fewer than 10% of all headaches. The American Council for Headache Education (ACHE) estimates that 95% of women and 90% of men in the united states and Canada have considered a type of primary headache, which means they are not caused by another medical condition or disorder. Other names for tension headache include muscle contraction headache, ordinary headache, psychomyogenic headache, and stress headache.

Tension headache are very common, affecting up to 78% of the general population. Unfortunately, they're also among the most neglected and difficult types of headaches to treat. If your headache happen 15 or more days in a month for several months, they are considered chronic tension headache. If they occur less frequently, they are called episodic tension headache. Although tension headaches can be painful, they are rarely a sign of a more serious illness. A combination of life style, changes, relaxation techniques and traditional and complementary therapies can help reduce the number of tension headaches you have.

Studies examined chronic tension type headache (CTTH) in children and adolescents mainly considers TTH in general and focuses on the internalizing aspects of functioning. Some works based on reports of adolescents with headache and of their parents, show an association between TTH, psychological stress, and internalizing problems (Bag et. al. 2005, Just et.al. 2003, Mazzone et.al. 2006) such as withdrwal, inhibition, shame, passiveness, fear of disease, anxiety and depression, but results are often conflicting (Just et.al 2003). Only a few studies (Mazzone et. al. 2006 Santalahti, Aromaa sourander Helenius, & Piha 2005, Virtanen et. al. 2004) focus on the relation between TTH and externalizing behavours (environmental conflict, impulsiveness, anger, antisocial behaviour).

The rationale for choosing these mood states is as follows. From a theoretical perspective, much of the research in this area draws upon the mood-congruency hypothesis, which is derived from an associative network model of memory (Bower, 1981). This model posits that mood states prime the recall of memories of a similar affective valence. Positive moods prime positive memories; negative moods, negative memories. A substantial amount of research supports this notion that mood states influence judgments in a mood-congruent manner. Positive moods result in more favorable evaluations, whereas negative moods result in more negative evaluations (see Blaney, 1986; Forgas, 1992, 1995; Gardner, 1985; and Luomala &Laaksonen, 2000). However, some studies have also found mood- incongruent results where mood effects in advertising 251 mar wilej right batch short standard Top of text Base of RF negative moods result in favorable evaluations (e.g., Erber&Erber, 1994; Rusting &DeHart, 2000).

OBJECTIVE

The study of migraine and tension headache is one of the great interests because the impacts of such behaviour mood states and coping of life. Thus in the light of proceeding review the major objective of the study is to assess and compare the mood states of tension headache patients and normal people. Present investigation will try to find that, is there any difference inmood states of normal respondents and tension headache patients?

HYPOTHESIS

The respondents belonging to normal population and tension headache patients would show significantly different on various dimensions of mood states.

PARTICIPANTS

The present study consists of 60 participants (30 tension headache patients and 30 normal respondents)belonging to 20 to 45 years of age group were selected on the recommendation of medical practitioner by following purposive sampling procedure. One inclusive criteria for the sampling is that, participants with at least 6 monthsof this problem. A number of extraneous variables like residence, education level and family structure as well as the age were recorded to insure relatively homogeneou-ssample. The consent of the participants was also taken for their cooperation.

BEHAVIOURAL MEASURE

The present study aims to investigate and compare tension headache patients and normal respondents on mood states. Following behavioral measure was used to obtain relevant data in the present study: ?

Eight State Questionnaire (8SQ):

This scale was constructed and standardized by M. Kapoor and M. Bhargwa, 1990. (Hindi adaptation of curan and cattell, Eight state questionnaire). It consists of 96 statements. This is a 4-point scale categorized into eight dimensions namely, Anxiety, Stress, Depression, Regression, Fatigue, Guilt, Extraversion and Arousal. Reliability co- efficient of the Eight State Questionnaire was calculated by Test- Retest Reliability method was established 0.91 and obtain concurrent validity co-efficient of the 8SQ scale is 0.71.

RESULTS AND DISCUSSION

The aim of the study was to assess and compare the migraine and Tension headache on the mood states. After scoring the obtained data were analyzed by using mean, SD and t- test. Outcomes of the analysis is presented below-

Table
Mean, SD and t - Values Scores on Dimension of Mood States for Tension Headache and Control Group.

Mood States	Category	N	Mean	SD	t-Value	Signific-anc
Anxiety	Tension headache patients	30	20.03	3.82	3.75	.01
	Control	30	16.17	4.15		
Stress	Tension headache patients	30	16.87	4.08	.465	NS
	Control	30	17.33	3.68		
Depression	Tension headache patients	30	19.00	2.87	.512	NS
	Control	30	18.57	3.63		
Regression	Tension headache patients	30	18.10	3.45	.181	NS
	Control	30	18.27	3.66		
Fatigue	Tension headache patients	30	18.27	4.06	1.64	NS
	Control	30	16.53	4.10		
Guilt	Tension headache patients	30	16.00	2.75	.088	NS
	Control	30	16.07	3.12		
Extroversion	Tension headache patients	30	16.80	3.87	1.40	NS
	Control	30	15.50	3.28		
Arousal	Tension headache patients	30	19.50	4.24	4.41	.01
	Control	30	14.67	4.22		

Table shows that mean, SD and t - Values Scores on dimension of Mood States for Tension headache patient sand Control Group. Table shows that there is significant difference between Tension headache patient sand control group on anxiety (t = 3.75, p < 0.01) and arousal (t = 4.41, p < 0.01). Table also shows that mean and SD of Tension headache patient son anxiety (M= 20.03, ± 3.82) and arousal (M= 19.95, ± 4.47) is higher than control group. Further result shows that there is no significant difference between Tension headache patientsand control group on stress (t = 0.465, > 0.05), depression (t = 0.512, > 0.05), regression (t = 0.181, > 0.05), fatigue (t = 1.64, > 0.05), guilt (t = 0.88, > 0.05), and extraversion (t = 1.41, > 0.05). Mean score of Tension headache patientson Regression (M= 18.10, ± 03.45) and Guilt (M= 16.00, ± 02.75) appears equal than control group.

Results show that patients of tension headache are sensitive towards anxiety and arousal related mood problems. While it was not found associated with other mood states like depression, regression, fatigue or guilt feeling. On the bases of findings, it may be argued that tension headache and different kind of anxiety disorder are often found with each other and arousal in mood is biologically natural reaction of any type of tension based headache. Doctors don't have a separate name for a stress or anxiety headache. But the most common types of headaches all have a link to anxiety. Laura Stiles (2016) from Seoul, Korea also found that patients with tension-type headaches (TTH) had a significantly higher prevalence of anxiety and depression compared with those without TTH. TTH symptoms were also worse in those who had anxiety or depression. Researchers noted that, the prevalence of anxiety in the patients of TTH is higher than the normal population (Song et al. 2016; Puca et al. 1999; Holroyd et al. 2000). The present researcher wants to suggest that the proper diagnosis and treatment of anxiety needed for the improved management of tension-type headaches.

A Study of Mobile Phone Addiction of Male – Female, School and College Level Student's

*Tripti Biswas

Research has been done on smart phone usage and its impact on all adolescents from so many years. Some researcher examined adolescent's physical health or educational performance with smart phone addiction and others analyzed psychological behavior and social relationship with mobile phone addiction. The present study has been undertaken to study the mobile phone addiction of school-college, male-female students of surguja district. The first problem of the present study was to examine whether male & female respondents would show significant difference in their mobile phone addiction. The second problem of the present study was to examine whether the school and college students would show significant difference in their mobile phone addiction. A total of 80 students 40 male and 40 female (age groups 15-25 years) were randomly selected for study. Mobile phone addiction scale developed by Dr. A. Velayudhan and Dr. S. Srividya was used. The data were analysed by using CR. Results show that CR for the gender and age towards mobile phone addiction were found to be insignificant.

People spend their time more likely on social media, do business emails, academic search, finding answers to questions and playing games. Mobile phone in India crossed 581 million users in 2014 and has been on a steady rise over the last decade. According to a survey by e- Marketer in 2015, India is estimated to have over 800 million mobile phone users in 2019. According to Cha and Seo (2018) around the world , smart phones were used by 1.85 billion people in 2014 which is expected to be 2.32 billion in 2017 and 2.87 billion in 2020. Mobile phone make our lives easier, but on the other hand, it ties us.

Mobile phone addiction not only has physical effects but also psychological and academics effect at the same time.

The major question is how do we get to know we are addicted to our cell phone? When a person uses his/her cell phone most of the time , unable to cut back on cell phone usage , using cell phones as a solution to boredom, feeling anxiety or depression when their phone is out of their range, losing their relationship.

Excessive use of smart phone paired with negative attitude and feeling of anxiety and dependency on gadgets may increase the risk of

* Asstt.Prof. & Head Department, Psychology Rajeev Gandhi Govt. P.G. College, Ambikapur

anxiety and depression. (Rosen et al.2013, Thomee et al., 2011).Jones (2014) conducted a survey about Elon students' behavior along with an online survey and found that students seemed to be addicted to their mobile phones. Nevertheless, it was concluded that the excessive smart phone use had a negative psychological effect. Another research was conducted on mobile phone usage in adolescents. It was concluded that mobile phone usage during night hours was common among youngsters and reported that poor perceived health was shown due to staying up all night (Schoeni et al.,2015). Researchers found an intensive increase of cell phone usage among teenagers and the symptoms of depression, suicide risk factors and suicide rate in the year 2012. Cell phone addiction is negatively correlated with academic performance(Ng et al.,2017;Baert et al.,2018; Lepp et al.,2015; Boumosleh and Jaalouk,2018; Arefin et al.,2017) did a case study on business students in Bangladesh and found that increased impatience and daily life disturbance negatively affected the academic performance of students. Thomee et al. (2011) proposed that high frequency of cell phone use had a risk of mental health outcomes when they had a 1- year followed up for young students aged 20-24. They concluded that high cell phone usage was associated with sleep deprivation and symptoms of depression for both men and women. De-Sola Gutierrez et al. (2016) revealed that the problematic cell phone usage had been associated with sleep deficit, depression, anxiety and stress. A researcher revealed that teenagers who spend more hours on their gadgets are highly likely more at risk of suicide. Another study by Augner and Hacker (2012) examined an association between over usage or dysfunctional usage of cell phones and psycho-

logical health. They found that low emotional stability , chronic stress and depression have a correlation with phone usage.

It is confirmed that adolescent's mental health and physical health is associated with cell phone addiction. But cannot say it with 100 % accuracy that mobile phone is the only cause of poor mental or physiological health issues in adolescents.

HYPOTHESIS:

It is hypothesized that the male and female respondents would significantly differ in their mobile phone addiction and the school and college students would significantly differ in their mobile phone addiction.

METHOD:

Sample:

A total of 80 students (40 males and 40 females) from schools (40) and colleges (40) constituted the sample for the study. The selection of the sample was based on simple random sampling technique.

Measures:

The mobile phone addiction scale was developed by Dr. A. Velayudhan and Dr. S. Srividya was used to examine mobile phone addiction of respondents. It has 37 items.

Procedure:

All the sample subjects were requested to fill the MPAS (Mobile Phone Addiction Scale) without omitting any item. This scale was administered in group setting and scoring of the scale was done according to the system mentioned in the manual of the scale. The data so collected were analyzed using mean, SD and CR to know the significance of difference between mean scores of college & school and male & female students.

RESULTS AND DISCUSSION:

Table 1
showing N, Mean, SD and CR of Male and Female respondents:

Sex	N	Mean	SD	CR	Result
Male	40	117.48	14.04	.36	NS
Female	40	116.23	16.98		

Table 2
showing N, Mean, SD and CR of School & Callege respondents:

Levels	N	Mean	SD	CR	Result
School	40	116.3	14.50	.32	NS
College	40	117.4	16.59		

The observation of the Table 1 reveals that the average scores of male students in 117.48 whereas it is 116.23 for female students. The average scores show that the male and female respondents are different in their mobile phone addiction. When difference of these two groups was tested by CR, the obtained CR was found to be insignificant (.36). The insignificant difference CR indicates that male and female students do not differ significantly in their addiction of mobile phone, rather they show almost equal level on mobile phone addiction. Nishad and Rana (2016) also believe that smart phone usage and gender are not significantly associated. The insignificant CR did not confirm the hypothesis that the male and female students would significantly differ in their mobile phone addiction.

An observation of Table 2 showed that the average scores of school students is 116.3, whereas it is 117.4 for college students. The average scores show that the school and college students are differ in their mobile phone addiction. When difference of these two groups was tested by CR, the obtained CR was found to be insignificant (.32). The insignificant difference CR indicates that school and college students do not differ significantly in their mobile phone addiction, rather they show almost equal level on mobile phone addiction. The insignificant CR did not confirm the hypothesis that the school and college students would significantly differ in their mobile phone addiction. These days most of the students have mobile phone and in mobile phone they have facility of internet and all. So that all the students use mobile phone

CONCLUSION:

On the basis of the findings of the present study, it was concluded that the male-female and school-college level students have similar addiction level of mobile phone. CR for the gender and age towards mobile phone addiction were found to be insignificant in the study.

Impact of Climate Change on Agriculture in Chhattisgarh

* **Sumita Shrivastava**
****Omkar Lal Shrivastava**

Climate change will have wide-ranging effects on the ecology, biodiversity and environment, and on socio-economic and related sectors like water resources, agriculture and food security, human health. India has undergone a series of ups and downs in agricultural production with the climatic conditions playing havoc in the years of abnormality. Currently, agro ecosystems are facing the problems of overexploitation of natural resources, decline in soil fertility, ground water level and agricultural productivity. One of the potential threats to agriculture is the impact of climate change in attaining sustainable development of agriculture coupled with food security. Climate change phenomenon is now a global reality. Chhattisgarh too faces the threat of climate change and its impacts. Available facts show that there is high chance of increase in the incidence and intensity of climate related natural hazards due to climate change and hence increase in probable threat due to climate change related natural disasters. In the (relative) absence of state level climate models and/or susceptibility studies, as well low community awareness, Chhattisgarh is potentially highly sensitive and exposed to climate change and its impacts. Agricultural productivity is nearly half the national average, mostly rain-fed and irrigation covers just 31 percent of the sown area. . In our paper we have tried to analyze the effects of climate change on Agriculture in Chhattisgarh.

Key Words: Climate change, Global Warming,Ecology, Biodiversity, Agriculture

1.1 Introduction: The official definition by the United Nations Framework Convention on Climate Change (UNFCCC) is that climate change is the change that can be attributed directly or indirectly to human activity that changes the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods. However, scientists frequently use the term for any change in the climate, whether arising naturally or from human causes. In particular, the Intergovernmental Panel on Climate Change (IPCC) defines climate change as a change in the state of the climate that can be identified by changes in the mean and / or the variability of its properties and that persists for an extended period, typically decades or longer. Global warming of land and sea continues to increase, and the levels of warming have been rising steadily every decade. Last three decades have been warmer than any previous decade since the year 1850. Global average temperature rose by 0.85 degrees Celsius (°C) between 1850 and 2012. While global warming is not spatially uniform across the globe, there is

* Department of EconomicsGovt. Digvijay P. G. College Rajnandgaon
** Head , Department of MathematicsGovt. Kamladevi Rathi Girls P.G. College Rajnandgaon

almost no region in the world that has not experienced some rise in average temperature.[1]

The Earth's climate has varied considerably in the past, as shown by the geological evidence of ice ages and sea level changes, and by the available records of human history. The exact cause of past changes is not always clear but is generally known to be related to changes in ocean currents, solar activity, volcanic eruptions and other natural factors. The dissimilarity now is that global temperatures have risen extraordinarily rapidly over the last few decades. There is strong evidence of raise in average global air and ocean temperatures, extensive melting of snow and ice, and rising of average global sea levels.

1.2. Indian Scenario: Presently, agro ecosystems are facing the problems of overexploitation of natural resources, decline in soil fertility, ground water level and agricultural productivity. One of the possible threats to agriculture is the impact of climate change in attaining sustainable development of agriculture coupled with food security. A succinct criticism of contemporary mainstream models has been made by the report of the High Level Panel of Experts (HLPE) on Food Security and Climate Change of the Food and Agriculture Organization (FAO): "None of these global scenario efforts attempts to address distributional issues within countries and the possibility that climate change affects the vulnerable disproportionately". As per the United Nations Report of FAO, India stands to lose 125 million tones equivalent to 18% of its rain fed cereal production from climate change by 2015.It would also cause a worldwide drop in cereal crops, leaving 400 million more people at risk of hunger, and leaving three billion people at risk of flooding and without access to fresh water supplies[2].

India is one of the most susceptible countries to climate change that is affecting agricultural production. Forecasts are made by the Indian Council of Agricultural Research (ICAR) using crop simulation mathematical models incorporating future projections. The Indian economy is mostly agriculture based and for irrigation depends on monsoon. The year 2002 was a classical example to prove how Indian food grains' production is dependant on rainfall of July. All-India drought was declared this year, as the rainfall deficiency was 19% and 29% of the area was affected due to drought. The "All-India drought" is declared when the rainfall deficiency for the Country as a whole is more than 10% of normal, and when more than 20% of the Country's area is affected by drought conditions. The kharif season food grain production was adversely affected by a whopping fall of 19.1% due to "All–India drought" during monsoon 2002. India is second highest populated country of the world and has only 2.4% of the land area of the World. It is bound to feed17.5% of the world population. India's economy and a majority of its population are highly dependent on climate sensitive sectors such as agriculture, animal husbandry, fisheries, tourism, etc. Since climate change is likely to impact natural and human systems negatively by inducing changes in these systems, India can be considered extremely vulnerable. Climate change is only likely to exacerbate India's already high physical exposure to climate-related disasters (65 percent of India is drought prone, 12 percent flood prone and 8 percent susceptible to cyclones). As a result, climate change is likely to impact livelihoods by disturbing social, cultural, economic, ecological systems, physical infrastructure, and human assets, accentuating health risks, and as such, posing severe risks to the development of the country[3].

The simulation studies by Indian Institute of Tropical Meteorology (IITM), Pune, estimated that annual mean surface temperature is expected to raise by the end of century, ranges from 3 to 5° C with warming additionally pro-

nounced with in the northern area of India. Changes in key climate variables, specifically temperature, precipitation and humidity, may have important long-term implications for the quality and quantity of water. River systems of the Brahmaputra, the Ganga, and the Indus, which gains from melting snow in the lean season, are probably to be affected by the decline in snow cover. A decrease in total run-off for all river basins, except Narmada and Tapti, is projected in India's NATCOM I. A decline in run-off by more than two thirds is also anticipated for Sabarmati and Luni basins. Due to sea level rise, the fresh water sources near the coastal regions will suffer salt intrusion.

1.3. Impact on Agriculture and Food Production: The contribution of agriculture to the Gross Domestic Product (GDP) has declined from 57% in 1950–51 to around 14% due primarily to growth in other sectors of the economy[4]. Food production in India is susceptible to climate changes such as unpredictability of monsoon rainfall and temperature changes within a season. Studies by Indian Agricultural Research Institute (IARI) and others indicate greater expected loss in the Rabi crop. Every 1°C rise in temperature reduces wheat production by 4-5 Million Tonnes. Minute changes in temperature and rainfall have noteworthy effects on the quality of fruits, vegetables, tea, coffee, aromatic and medicinal plants, and basmati rice. Pathogens and insect populations are highly dependent upon temperature and humidity, and variation in these parameters may change their population dynamics.

Other effects on agricultural and related sectors include decline in yields from dairy cattle and decrease in fish breeding, migration, and harvests. Global reports point out a loss of 10-40% in crop production by 2100. Indian climate is dominated by the southwest monsoon, which brings most of the region's precipitation. It is critical for the availability of drinking water and irrigation for agriculture. Agricultural output is sensitive to two broad classes of climate-related effects (1) direct effects from variation in temperature, precipitation or carbon dioxide concentrations, and (2) indirect effects through changes in soil moisture and the distribution and frequency of invasion by pests and diseases. Rice and wheat yields could decline considerably with climatic changes [5].

The loss in net revenue at the farm level is estimated to range between 9% and 25% for a temperature rise of 2 °C to 3.5 °C. Scientists also estimated that a 2°C rise in mean temperature and a 7% increase in mean precipitation would reduce net revenues by 12.3% for the country as a whole. Increase in temperatures will cause shifts in crop growing seasons, which in turn will affects food security. Rise in temperature will potentially severely increase rates of extinction for many habitats and species (up to 30 percent with a 2°C rise in temperature). A rise in extreme events will have effects on human health and lives as well as related environmental and economic impacts. Sinha and Swaminathan (1991)[6] showed that an increase of 2 degree Celsius in temperature could decrease rice yield by about 0.75 tons/ha in the high yield areas; and a 0.5 degree Celsius increase in winter temperature would decrease wheat yield by 0.45 ton/ha.

Agricultural productivity is nearly half the national average, mostly rain-fed and irrigation covers just 31 percent of the sown area. . In our paper we have tried to analyze the effects of climate change on Agriculture in Chhattisgarh.

Chhattisgarh too faces the threat of climate change and its impacts. Available evidence shows that there is high possibility of increase in the occurrence and intensity of climate related natural hazards due to climate change and hence increase in probable threat due to climate change related natural disasters. In the (relative) absence of state level climate models and/or sus-

ceptibility studies, as well low community awareness, Chhattisgarh is potentially highly sensitive and exposed to climate change and its impacts.

Methods: This paper is mainly based on secondary sources, focusing on qualitative studies as well as quantitative Metrological data . For the present study the data were collected from Census Report, statistical reports and other sources also.

2.1. **Profile of study area: Chhattisgarh**: Chhattisgarh is a state in Central India and was formed on November 1, 2000 by partitioning 16 Chhattisgarhi-speaking southeastern districts of Madhya Pradesh. Chhattisgarh has 28 administrative districts. The new districts have been created by carving out the existing districts to facilitate more targeted, focused, and closer administration. Chhattisgarh borders the states of Madhya Pradesh in the northwest, Maharashtra in the west, Andhra Pradesh in the south, Orissa in the east, Jharkhand in the northeast and Uttar Pradesh in the north. Chhattisgarh is the 10th largest state in India, with an area of 135,190 km^2 . The northern and southern parts of the state are hilly, while the central part is a fertile plain. Deciduous forests of the Eastern Highlands Forests cover roughly 44 percent of the state. In the north lies the edge of the great Indo-Gangetic plain. The Rihand River, a tributary of the Ganges, drains this area.

2.2. **Geography of Chhattisgarh**: Chhattisgarh lies between 17°47' and 24°06'N latitude and 80°15' and 84°24'E longitude . The state measures 640 km from north to south and 336 km from east to west with a total area of 135,194 km^2 .The eastern end of the Satpura Range and the western edge of the Chhota Nagpur Plateau form an east-west belt of hills that divide the Mahanadi River basin from the Indo-Gangetic plain. The central part of the state lies in the fertile upper basin of the Mahanadi River and its tributaries. This area has exten-

sive rice cultivation. The upper Mahanadi basin is separated from the upper Narmada basin to the west by the Maikal Hills (part of the Satpuras) and from the plains of Orissa to the east by ranges of hills. The southern part of the state lies on the Deccan plateau, in the watershed of the Godavari River and its tributary, the Indravati River. The Mahanadi is the chief river of the state. The other main rivers are Hasdo (a tributary of Mahanadi), Rihand, Indravati, Jonk, Arpa, and Shivnath.

Chhattisgarh has a tropical climate with three major seasons: summer , monsoon and winter. It is hot and humid because of its proximity to the Tropic of Cancer and its dependence on the monsoons for rains. Summer in Chhattisgarh is from April to June and temperatures can reach 48°C (100°F). The monsoon season is from late June to October and is a welcome respite from the heat. Chhattisgarh receives an average of 1,292 millimetres (50.9 in) of rain. Winter is from November to January and it is a good time to visit Chhattisgarh. Winters are pleasant with low temperatures and less humidity. The temperature varies between 30 and 47°C (86 and 117°F) in summer and between 5 and 25°C (41 and 77°F) during winter. However, extremes in temperature can be observed with scales falling to less than 0°C to 49°C.

2.3 Demography of Chhattisgarh: The majority of the population of Chhattisgarh lives in rural areas (76.76%) as compared to urban population (23.24%). In actual numbers of males and females were 12832895 and 12712303 respectively. In rural area female sex ratio per 1000 males was 1001 while for the child (0-6 age) it was only 977 girls per 1000 boys. Child population forms 14.92 per cent of total rural population. Literacy rate in rural areas was 65.99 per cent in which 76.98% males were literate while female literacy rate of 55.15%. The population of urban male and female were 51.12, 48.87 per cent to total population. Sex ratio in

urban area was 956 females per 1000 males, while for child (0-6) sex ratio for urban area stood at 937 girls per 1000 boys. There were 12.41 % of children (0-6) in total population of urban areas average literacy rate in urban area was 84.05 per cent in which, males 90.58% literate, while female literacy stood at 73.39 per cent[7].

2.4 Economics of Chhattisgarh : According to the NSSO data (68th round) poverty ratio of Chhattisgarh is highest (39.93%) in India[8]. Almost 80 per cent of the population is dependent on agriculture or agriculture-related occupations [9].

2.5 Labour Force Participation: The total working population belongs to cultivators (49.45%) followed by others (26.30%), agriculture labour (22.00%) and household industry workers (2.25%) . The total rural working population was found to be maximum in the rural areas (83.40%) as compared to the urban areas (16.60%). In rural areas the maximum working population related of cultivators (58.54%) followed by agriculture labour (25.74%), other (13.73%) and household industry workers (1.99%), while in urban areas contributed of other workers (89.50%) was found to be maximum followed by cultivators (3.76%), household industry workers (3.59%) and agriculture labour (3.16%).

2.6Crops of Chhattisgarh: The various crops are grown by the cultivators in Chhattisgarh. The rice (68.8%) was found to be major crop of the state. The cultivators are also found to be grown tiwra (6.5%), gram (4.6%), paddy (2.6%), kodo-kutki (2.3%) and wheat (1.9%). The maize, urd, niger, soybean, arhar, mustard, kulthi, alsi, groundnut, til, masoor, pea, moong, moong, jwar, urd, sunflower, kulthi and safflower are also grown in small proportion by the cultivators in the state.

3.1Data Analysis: The change in cropping pattern of Chhattisgarh: It is observed from the data[10] that gross cropped area of Chhattisgarh has been found to be decreased by1.09per cent in the year 2011-12 (4571.57thousand ha.) over the year 2000-01 (4622.35 thousand ha.). The area under pulses, oilseeds and cereals found to be increased by 31.5, 10.0 and 1.4 per cent during this period. As regards to the change in area under different crops the cultivated, area under soybean (448.3%) increased maximum followed by sunflower (288.5%), summer paddy (175.3%), gram (81.0%), pea (60.2%), rabi moong (45.4%), tiwra (43.2%), wheat (33.2%), niger (28.9%), masoor (27.8%), maize (10.0%), other kharif cereals (10.5%), arhar (10.3%), other kharif pulses (8.6%), mustard (4.4%), and rice, (1.9%), while the area under barley & other (-90.3%), rabi alsi (-58.4%), kharif kodo-kutki (-46.1%), jwar (-40.0%), rabi kulthi (-39.5%), sunflower & others (- 38.6%), kharif kulthi (-20.8%), rabi urd (-17.3%), til (-16.1%), safflower (-15.8%), groundnut (- 13.5%), kharif urd (-12.4%) and kharif moong (-7.0%), were found to be decreased in the year 2011-12 as compared to 2000-01.

3.2 Changes in Production: The total production of kharif crops in Chhattisgarh found to be increased by 40.98 per cent in the year 2011-12 (6444.73 MT) over the year 2000-01 (2641.32 MT), while the total production of Rabi crops increased with 35.77 per cent. The production of cereals, pulses and oilseeds was found to be increased by 167.5, 106.1 and 95.5 per cent. As regards to production of all major crops the production summer paddy (84.0%), niger (54.8%), gram (32.2%), rice (63.50%), tiwra (10. 4%), soyabean (-3.4%), til (73.9%), rabi moong (71.3%), wheat (53.2%), Pea (49.5%), masoor (47.1%), maize (47.8%), jwar (44.6%), sunflower (21.8%), rabi groundnut (16.8%), arhar (12.8%) and kharif moong (11.3%), was found to be increased while, the production of linseed (-58.2%), kulthi (-37.1%), kharif kulthi (-23.4%),

mustard (- 21.8%), safflower (-17.2%), kodo-kutki (-16.8%), rabi urd (-11.2%), kharif urd (-10.0%) and other cereals (-3.1%), was found to be decreased in the year 2011-12 as compared to 2000-01.

The rainfall variability during past century in Chhattisgarh was studied using rainfall statistics of 100 years i.e. 1901-2000. About 40 rain gauge stations located in different districts of Chhattisgarh were considered for study[11]. For understanding the rainfall pattern difference between average rainfall during 1900-1950 and 1951-2000 were worked. A GIS map was generated using GIS tools and the same are show in enclosed figure

Rainfall decrease during the period 1951-2000 as compared to normal (1901-50) values in Chhattisgrh
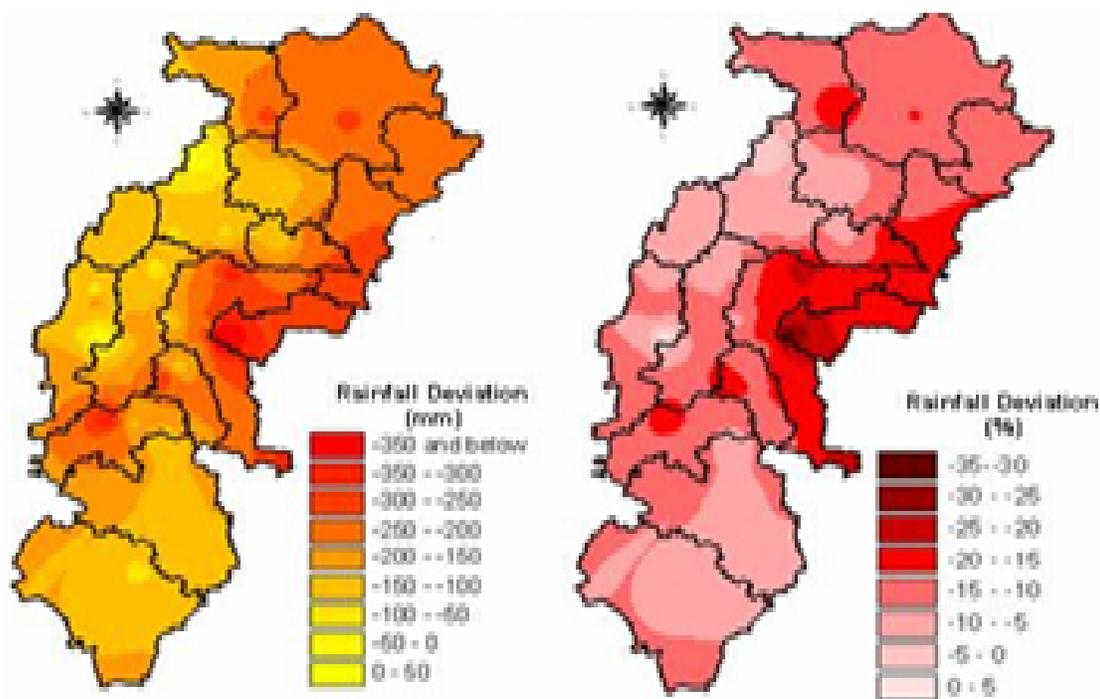

Source: National Climate Centre, IMD , Pune-2006

3.3 Trends In Regional Distribution of Rainfall: Analysis based on IMD[12] rainfall series indicated that during the monsoon season , three subdivisions viz. Jharkhand, Chhattisgarh, Kerala show significant decreasing trend and eight subdivisions viz. Gangetic West Bengal, West Uttar Pradesh, Jammu & Kashmir, Konkan & Goa, Madhya Maharashtra, Rayalseema, Coastal Andhra Pradesh and North Interior Karnataka show significant increasing trends . However, analysis of IITM rainfall series (1871-2011) indicates presence of significant trend only in case of Chhattisgarh (decreasing) and Konkan and Goa (increasing) (non parametric Mann Kendall Test, Run test). Both these were observed to have strongest trend even in IMD series study (99 and 95 per cent level of significance respectively).

Trends in Regional Distribution of Rainfall
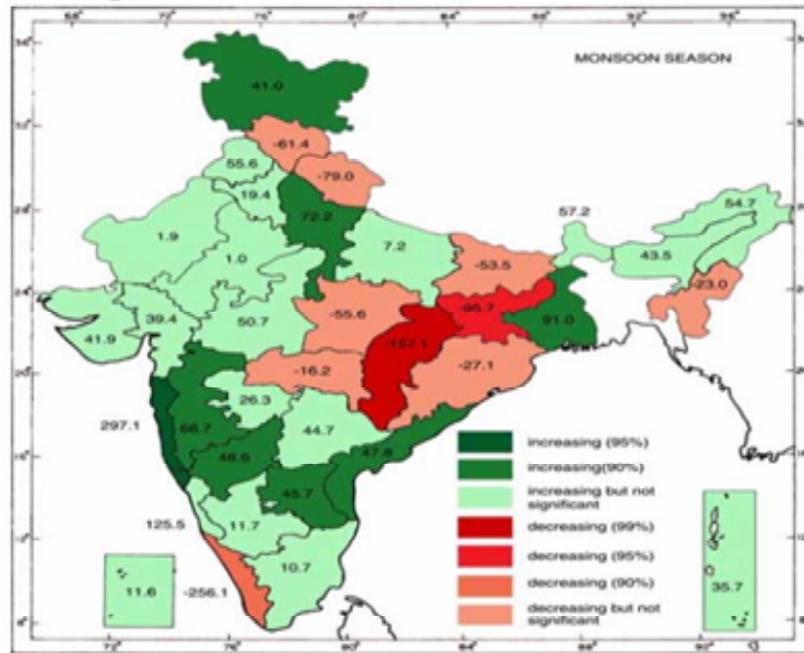

Increase/ decrease in rainfall in mm in 100 years for each of 36 Sub Divisions for SW Monsoon season Different level of significance are shaded with colors

Source: National Climate Centre, IMD , Pune-2006

3.4 Discussion : Quantification of climate change is very necessary to cope up with ever changing conditions. The trend analysis is made for Chhattisgarh for monthly rainfall data for the period of 1901-2002 is performed using nonparametric Mann-Kendall and Sen Slope Estimator test. The results reveal a values are 1.0351,-1.4775, 0.1099, 0.0289, 0.8154, - 0.9484, -1.2317, -1.1103, -2.1165, 0.5204, 0.0405and -1.2028 for January to December respectively. The months of February, June, July, August, September and December clearly show a significant declining trend in rainfall whereas the months of March, April and May represent no trend for monthly rainfall for 1901-2002. The

months of January, May and October exhibit an increasing trend of rainfall, but among them, trend in January only can be considered as remarkably increasing. So far as Chhattisgarh, is concern, we highlight the significance of studying both present climate changeability and future climate change at local levels. While rainfall variability is an important factor contributing to short-term variations in agricultural output, we suggest the need to move away from this traditional emphasis by also taking into account temperature variation. The concentrations of the greenhouse gases carbon dioxide and nitrous oxide in the atmosphere are now at levels that "substantially exceed" the highest levels of these concentrations known on earth for the last 800,000 years.

3.5 Conclusion : The data indicate that the decrease in monsoon-time precipitation in Chhattisgarh, and the increase in precipitation in the Konkan and Goa sub-divisions, are statisti-

cally significant. Climate change will have wide-ranging effects on the ecology, biodiversity and environment, and on socio-economic and related sectors like water resources, agriculture and food security, human health. India has undergone a series of ups and downs in agricultural production with the climatic conditions playing havoc in the years of abnormality.

There is evidence[13] that greater climate variation alone can lower yields to an extent comparable to (or greater than) the impact of increased mean temperature. Ongoing climate change through rising temperatures has had a negative impact on crop production in different parts of the world, though this impact has been more than offset in practice by better management and other technological factors. There is little evidence at present that climate change has had any widespread impact on yields or on total agricultural production in India[14]. The impact of variations in temperature and precipitation on agriculture is an important source of information for coping with the impact of climate change on agriculture in the future. In particular, apart from variations in rainfall, which have traditionally been the primary concern with regard to the relation between climate and agriculture in Chhattisgarh, the impact of temperature variations also needs seriously to be considered.

Concept of Right to Property in Indian Constitution
(With special reference to land)

* **Bhoopendra Karwande**

Right to property as fundamental right created a barrier for both the government and landless people as the government was unable to generate the comprehensive revenue from the land where as the landless are unable to cultivate and earn their livelihood aptly. To overcome this issue the status of the right to property was changed from fundamental rights to constitutional right. As per the social economic and caste census of 2011, which acknowledge and counted landlessness as a major poverty indicator and the data that came out is shocking which reveals that nearly 494, 9 million (49.9 Crore) people are still landless in India after so many years of independence. With so much significance on market-driven economy has resulted into the negligence of such an important trend. This paper depicts a subjective look at the attribute of the constitutional and other amendments in land laws as Zamindari abolition Act, ceiling Act and other laws. It also explains how it stems the agrarian reform to the last straw. Further discussion on the contradiction of land laws with the Constitution of India in the light of Supreme Court judgments and its impact on landless persons. The paper provides an objective look into the legal provisions regarding the right to property and suggests essential changes which might be beneficial for both government and landless persons into the long run.

1) Introduction

As per the resolution mentioned in Preamble we, the people of India adopted the Constitution on 26th November 1949. In which the various land laws measures are as following:

1. Right to property
2. Fundamental rights (article 31A, 31B, 31C.)

Meaning of property:

In general term: The word property means everything which is subject of ownership, corporeal or incorporeal, tangible or intangible visible invisible, real or personal, everything which has exchangeable value or which goes to make up wealth. Private property also comes under the ambit of it.

In the legal term: Anything that is owned by a person or entity. Property is divided into two types: "real property" which is any interest in land, real estate, growing plants or the improvements on it, and "personal property" (sometimes called "personality") which is everything else. "Common property" is ownership by more than one person of the same possession. "Community property" is a form of joint ownership between husband and wife recognized in sev-

* Asst. Prof. LawGovt. J.Y. Chhattisgarh College Raipur(C.G.)

eral states. "Separate property" is property owned by one spouse only in a community property state, or a married woman's sole ownership in some states. "Public property," refers to ownership by a governmental body such as the federal, State, county or city governments or their agencies (e.g. school or redevelopment districts). The Government, and, in particular, the courts are obligated to protect property rights and to help clarify ownership.[1]

According to Article 17 of the Universal Declaration of Human Rights[2]

(1) Everyone has the right to own property alone as well as in association with others.

(2) No one shall be arbitrarily deprived of his property.

2) Right to the property before the 44th amendment 1978[3]

Right to property was the 7th kind of Fundamental Right enshrined in the original Constitution and guaranteed by Article 19(1) (f) and Article 31.

Article 19 (1) (f): to acquire, hold, and dispose of the property.

Article 31: Ensures that any person could not be deprived of property except by authority of law. It also mentioned that the State could acquire property only for public purposes and in return of which compensation had to be paid.

At the time when the Indian Constitution was adopted, the organization of land was dominated by Zamindars, intermediary, Ryotwari settlement, Mahalwari settlement, etc. and a substantial portion of the land was cultivated through tenants at will and sharecroppers who were paying about one half of the produce as rent to the Government and holding were very small. So, for doing justice with landless or poor people, to uplift them, Indian Government started passing various laws like Zamindari abolition Act, Land ceiling Act and Land tenure Act, etc. But in these laws, some part becomes contradictory to the 3rd part of the Constitution i.e. Fundamental Rights especially to

Article 19(1) (f) and Article 31.

For example:

1.Zamindari Abolition Act[4] becomes challengeable in the court because it was contradictory to Fundamental Rights Article 19(1)(f) and Article 31 as these two Article says that person having right to acquire ,hold and dispose of property but Zamindari abolition Act is obstructing people to acquire land and getting proper compensation.

2. Land Ceiling Act: By this Act limit of holding land was decided and land beyond the limit would go in the account of Government, which again became contradictory to Article 19(1)(f) and article 31.

Therefore to remove such complication and betterment of all, Article 19(1) (f) and Article 31 repealed by the 44th Amendment Act.

3) Right to the property after the 44th amendment 1978

By 44th Amendment the Article 300 A came into the picture by redrafting the article 31(1) as Constitutional right. Article 31A, 31B, and 31C were added by 1st and 25thAmendment, the reason behind such additions are:

Firstly Article 31 A was added to remove the compensation-related problem arising out of Zamindari abolition Act. The importance of this Article increased by the 44th amendment.

Secondly, Article31 B validates the Acts and regulations specified in the 9th Schedule. The laws and regulations related to 9th Schedule, which passed before the Case of Kesavanda Bharati Sripadagalvaru and Ors. V State of Kerala[5] could not be challenged in court based on contradiction with Fundamental rights.

Thirdly, Article 31C approves laws giving effect to the policy of the State towards achieving all or any of the principles enshrined in Part IV (Directive principle of state policy) of the Constitution. The objective of this article was to ensure a socialistic pattern of society in the country. The ambit of this Article was also extended

by the 42nd Amendment Act, 1976. The extension of the range of the Article 31-C to all directive principles was held to be ultra vires by the Supreme court inthe case of Minerva mills case[6]

Article 300A gives protection against deprivation of property. A person can only be deprived of his property by the authority of law. Its means proper compensation shall be givenfor deprivation according to laws made under Article 31A.Such denial can't be questioned before any court. The remedy under Article 32 is not available against the violation of Article 300. But a person has the right to file a civil suit in civil court and the high court under Article 226.

4) Deprivation: Deprivation occurs when a substantial bulk of the rights constituting property is taken away.

For example:

1. The owner dispossessed,
2. The property seized or confiscated,
3. A business was taken over by the State,
4. A trustee removed from the trust etc.

Deprivation does not necessarily mean that the State has acquired the property. If the Government pulls down or demolishes a house to prevent the spread of fire, the owner deprived, but the property has not obtained.

The law mentioned in the Article 300A subjected to the Article14; Article 19

5) Conclusion

The provisions and historical background of the Right to Property show that step of removing out the right to property from the fundamental right was to save, uplift more underprivileged sections. And to take out more revenue from land as a tenant at will and sharecropper was unable to pay much to the Government as their part on land was less. Time passes by with the popup of new sources of taxes and revenue which made the concept of revenue from land vanish. It is such revenue from which dream of upliftment of tenure holder and poorer section was built and above mention actions by the Government of India took place. So presently at the age of 72 of India, we should remember its importance, to revive land revenue again to spread its benefit to the above said group and Government too. The scope of this section now will also apply to Jammu and Kashmir from 5th August 2019 onwards which means it will get the more enhanced range.

Pseudo-contractive mappings and fixed points and it's application in social, economical, science and different fields

* Chetan Kumar Sahu
**Subhash Chandra Shrivastava
***S. Biswas

We give some Reviews on Pseudo contractive mapping & fixed point Theory .We also show how the fixed point theory is applicable in different stream. We reviews the proof of some fixed point theorems for pseudo-contractive mappings in Banach space and different spaces.

Keywords : Fixed points, contraction mapping, pseudo contractive mapping non-expansive mapping, multifunction, commuting mappings.

INTRODUCTION

Most important nonlinear problems of applied mathematics reduce to finding resolutions of nonlinear functional equations (e.g. nonlinear integral equations, boundary value problems for nonlinear ordinary or partial differential equations, the existence of periodic solutions of nonlinear partial differential equations). It can be formulated in terms of finding the fixed points of a given nonlinear mapping on an infinite dimensional function space X into itself.

The theory of fixed point is one of the most powerful tool of modern mathematical analysis. Theorem concerning the existence and properties of fixed points are known as fixed point theorem. Fixed point theory is a beautiful mixture of analysis, topology & geometry which has many applications in various fields such as mathematics engineering, physics, economics, game theory, biology, chemistry, optimization theory and approximation theory etc. Fixed point theory has its own importance and developed tremendously for the last one and half century. The purpose of the present paper is to study the development of fixed point theory

Origin of pseudo contractive mapping

The definition of monotone operator intimately related to pseudo contractive mapping was first given by Kachurovski and iterative methods for strongly monotone operators in Hilbert space satisfying a Lipschitz condition were first given by Zarantonello and Vainberg . The first surjectivity theorem for monotone operators was given by Minty. Later, Surjectivity results proved for different type of monotone operators were applied to get existence and uniqueness results for corresponding operator equations. This Theory is now widely developed

* Kalinga Universitys Rauipr*
**Rungta College of Engineering & Technology Bhilai
***Kalinga Universitys Rauipr

The notion of monotone operators could be considered as a generalization of the concept of accretive operators in the Hilbert space H i.e. $F : H \rightarrow H$ is monotone if and only if $(J + \lambda F)$ is accretive for every $\lambda > 0$. The accretive operators were introduced independently in 1967 by Browder and Kato. Interest in such mappings developed mainly due to their connection with equations of evolution. It is well known that many physically significant problems can be modeled by initial value problems of the form $x'(t) + Ax(t) = 0, x(O) = X_o,$ where A is an accretive operator in an appropriate Banach space. Typical examples where such evolutions occur can be found in the heat, wave or schrodinger equations. The solutions of the equation $Ax = 0$ are precisely the equilibrium points of the system . The class of non expansive mappings in Banach spaces has very interesting links with the theory of monotone and accretive mappings. The existence of fixed points of non expansive mapping was independently given by Browder , Gohde and Kirk in 1965. According to them non expansive, accretive and monotone mappings are related to each other as follows:
If T is a non expansive mapping, then U : I-T is monotone in Hilbert space from any subset D of H into H and accretive operator in Banach space into itself. But converse of this is not valid i.e. if U is

monotone or accretive operator then T = I -U is not non expansive . This is the reason why pseudo contractive operator is introduced. The class of pseudo contractive operator is introduced by Browder and Petryshyn in 1967 in Hilbert space and proved that U is pseudo contractive operator if and only if T = I - U is monotone operator. They proved the existence results and then convergence results for this class of mappings in Hilbert space using Krasnoselskij iteration. In the same year, Browder alone gave the existence of fixed points of pseudo contractive mapping in real uniformly convex Banach space or real Banach space with uniform structure and proved that the class of pseudo contractive operators includes the important class of non expansive operators and also showed that T is pseudo contractive if and only if
 A = I - T is accretive. Fixed point theorems for pseudo contractive mappings play an important role in the theory of nonlinear mappings because of their connection with the accretive operators .Browder and Kato independently of each other, characterized pseudo contractive mappings as those mappings T for which the mapping A = I - T is accretive. Consequently, considerable efforts have been devoted to the methods of approximating equilibrium points

(when they exist) of the initial value problems . Since a map T is pseudo contractive if and only if A = I-T is accretive so that solution of Ax = 0 for accretive operator A corresponds to fixed point of T.

HISTORY OF FIXED POINT THEORY

In the 19th century The study of fixed point theory was initiated by Poincare and in 20th century developed by many mathematicians like Brouwer, Schauder, Kakutani, Banach, Kannan ,Tarski , and others:

Let T be a self mapping on a set X. An element u in X is said to be a fixed point of the mapping T if Tu = u. The fpth (= fixed point theorem) is a statement which

asserts that under certain conditions (on the mapping T and on the space X), a mapping T of X into itself admits one or more fixed points. History is a meaningful

record of man's achievement and historical research is the application of scientific

method to the description and analysis of past events. In this paper, we have tried

briefly to present a history of pseudo contractive mapping & fixed point theorem. There are plenty of results on different cases of fixed point theorems and this paper is basically a survey work, which deals with almost all earlier settings of fixed point theorems, with

suitable examples. Historically, the most important result in the fixed point theorems is the famous theorem of L.E.T. Brouwer which says that every continuous self-mapping of the closed unit in R^n, the n-dimensional Euclidean space, possesses a fixed point. This result, published by Brouwer (1910), was previously known to H. Poincare in an equivalent form.

In 1986, poin proved the following result the following result: If $f:E_n \rightarrow E_n$ is any continuous function with the property that, for some r > 0 and say a > 0,

$f(x)+a(x) \neq o$, $ll\ x\ ll = r$ then there exists a point x_0 ; $l\ l\ x_0\ ll \leq r$ such that $f(x_0) = x_0$.

A.L.Cauchy (1844) was the first mathematician to give a proof for the existence and

uniqueness of the solution of the differential equations $\frac{dy}{dx}$ = f(x,y) ; $y(x_0)$ = y_0 when f is a continuous differentiable function. R. Lipschitz (1877) simplified Cauchy's proof using which is known today as 'Lipschitzs' condition . later G. Peano (1890) established the deeper result, supposing only the continuity of F. Peano's approach is more related to modern fixed point theorems, which is used I to obtain existence theorem.

Also, E. Sperner (1928) proved the combinatorial geometric lemma on the decomposition of a triangle, which plays an important role in the theory of fixed points.These are the most important tool, for proving the existence and uniqueness of solutions to various mathematical modols (differential, integral,ordinary and partial differential

equations, variational inequalities), other fields are
Steady-state tempreture distribution,Chemical reactions, Neutron transport
theoty, Economic theory, economic theory, game theory, Flow of fluids' Optimal control
theory, Fractals, etc.
 SOME DEFINATION

1. **metric space:**A metric space is a set *X* together with a function *d* (called a **metric** or "distance function") which assigns a real number *d(x, y)* to every pair *x, y* ∈ *X* satisfying the properties (or *axioms*):

1. $d(x, y) \geq 0$ and $d(x, y) = 0 \Leftrightarrow x = y$,
2. $d(x, y) = d(y, x)$,
3. $d(x, y) + d(y, z) \geq d(x, z)$.

2. Banach Space: A normed space X is called a Banach space if it is complete, i.e.,if every Cauchy sequence is convergent.That is, $\{f_n\}$ n ∈ N is Cauchy in X then ∃!f ∈ X
such that $f_n \to f$

**3.Hilbert Space:** A complex inner product space together with inner product :a function from X×X→C satisfying:
(1) (x y) ≥0, (x y)=0 iff x=0 for all x, y in X
(2) (ax+ay,z) =a(x,z) + b(y,z) ∀'a, b in C and ∀'x, y, z in X
(3) (x,y) = $\overline{(y, x)}$

4.**Mapping or Functions**: If A and B are two non-empty sets, then a relation 'f' from set A to set B is said to be a function or mapping,

● If every element of set A is associated with unique element of set B.

● The function 'f' from A to B is denoted by f : A→ B

? If f is a function from A to B and x ∈ A, then f(x) ∈ B where f(x) is called the image of x under f and x is called the pre image of f(x) under 'f'.

A   B   A   B
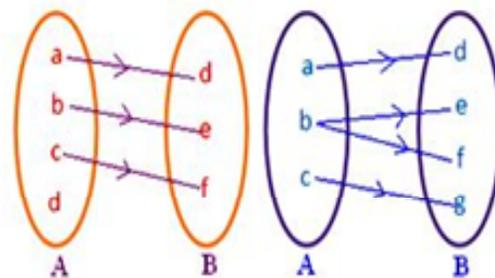

5.**contraction mapping:** Let X be a complete metric space. Then a map T: X→X is called a contraction mapping on X if there exists k ∈ (01) such that
$d(T(x),T(y)) = d(x y)$ for all x and y in X

6.Non Expansive & Pseodo Contractive Mapping: Let E be a Banach space, X a subset of E, and f a mapping of X into E. Then f is said to be non expansive if for all
x, y ∈ X, $\|f(x)-f(x)\| \leq \|x-y\|$ while f is said to be pseudo-contractive if for all x, y ∈ X and
$r > 0, \|x-y\| \leq \|(1+r)(x-y)-r(f(x)-f(y))\|$

7. **Lipschitzian mapping**: Let (M,ρ) be a metric space and let T : M→ M be a mapping. We say that T satisfies a Lipschitz condition with constant k = 0 if for all x, y ∈ M,
$\rho(T x, T y) = k\rho(x, y)$ then T is called Lipschitzian mapping and k is called Lipshhitzian constant.

8. 2-Normed Space: Let X be a real vector space of dimension d, where $2 \le d$. A real-valued function $\| \prime,. \|$ on X_2 satisfying the following four conditions:
(1) $\| x_1, x_2 \| = 0$ if and only if x_1, x_2 are linearly dependent,
(2) $\| x_1, x_2 \|$ is invariant under permutation,
(3) $\| \prime \alpha x_1, x_2 \| \prime = |\alpha| \| x_1, x_2 \| \prime$, for any $\alpha \in R$,
(4) $\| x + x', x_2 \| \prime \le \| x, x_2 \| \prime + \| x', x_2 \| \prime$, is called a 2-norm on X, and the pair (X, $\| \prime,. \|$) is called a 2-normed space.

Some Theorems

1: Let X be a Banach space, $K \subseteq X$ a closed convex subset, $U \subseteq K$ a bounded set, open in K and $u_o \in U$ a fixed element. Assume that the operator $T : \overline{U} \to K$ is completely continuous and satisfies the boundary condition $u \ne (1 - \lambda) u_o + \lambda T (u)$ for all $u \in \partial U, \lambda \in (0,1)$ Then T has at least one fixed point in $\overline{U}$.

2: Let X be a subset of a Banach space E and let f: $X \to E$ be a continuous pseudo-contractive mapping. If $A_f : X \to E$ is defined by $A_f : X \to E$ then:
(a) A_f is one-to-one and A_{f-1} is non expansive.
(b) f and A_f have the same fixed points.
(c) If X is closed, $A_f [X]$ is closed.
(d) If X is open, then $A_f [X]$ is open.

3: Let X be a hounded closed subset of a Banach space E (with int (X)$\ne \Phi$). Suppose f:$X \to E$ is a continuous pseudo contractive mapping and suppose there exists $z \in X$ such that $\|z - f(z)\| < \|x - f(x)\|$ for all $x \in \partial X$. Then inf { $\| x - f(x) \|: x \in X$} = 0. If in addition X has the fixed point

4: Let E be a Banach space, f:$E \to E$ a continuous pseudo-contractive mapping and suppose that for some $\partial > 0$ the set $\{x \in E: \| x \to f(x) \| \le \partial\}$ is nonempty and bounded. Then inf { $\| x - f\{x\} \|: x \in E$} . If in addition closed balls in E have the fixed-point property with respect to non expansive self-mappings, then f has a fixed point in E.

5: Let E be a Banach space and T: $E \to E$ a continuous accretive transformation such that $\| T(x) \| \longrightarrow \infty$ a $\| x \| \to \infty$ Then the range of T is dense in E. If in addition closed balls in E have the fixed point property with respect to non expansive self-mappings, then the range of T is all of E.

6: Suppose E is a reflexive Banach space such that every nonempty closed bounded and convex subset of E has the fixed point property with respect to non expansive self mappings and suppose f:$E \to E$ is a continuous pseudo-contractive mapping. If $x_n - f(x_n) \to 0$ strongly for some bounded sequence $\{x_n\} \subseteq E$, then f has a fixed point.

7: Let E be a uniformly convex Banach space, X a bounded closed convex subset of E with int (X)$\ne \Phi$ and G an open set containing X such that dist(X, E\G) > 0. Suppose f:$G \to E$ is a continuous pseudo-contractive mapping which sends bounded sets into bounded sets and satisfies for some $z \in$ int (X): $f(x) - z \ne \lambda (x - z)$ for $x \in \partial X, \lambda > 1$. Then f has a fixed point in X

8: Let E be a Banach space, X a closed bounded and convex subset of E with int(X)≠Φ and f:X → E a continuous pseudo-contractive mapping such that f[X] is bounded. Suppose there exists z ∈ int (X) such that f(x) - z ≠ λ (x- z) for x ∈ ∂X , λ > 1 .
Then
inf { ll x - f(x) ll: x ∈ X) = 0.

9: Let X be a uniformly convex 2-Banach space and B be a closed sphere in X . Let U be a Lipschitzian pseudo contractive mapping from B to X such that U also maps boundary of B into B. Then U has a fixed point in B.

10: Let X be a 2-Banach space , G be an bounded subset of X with G∈0 and U be a Lipschitzian pseudo contractive mapping from G to X satisfying
1.U(x) ≠ λ (X) if x∈∂G
2.(I- U) G is closed Then U has a fixed point in G.

11. If X is a complete metric space and T : X → X is a contraction map, then f has a unique fixed point or T (x) = x has a unique solution.

APPLICATIONS TO FIXED POINT THEOREM

There are so many applications of fixed point theorems. Some of the applications are as follows:

1.Integral equations: These equations occur in applied mathematics, engineering and mathematical physics. They also arise as representation formulas in the solution of differential equations.

2.The Method of Successive Approximations: This method is very useful in determining solutions of integral, differential and algebraic equations.

3. Chemistry: We consider the mathematical model for an adiabatic tubular chemical reactor which processes an irreversible exothermic chemical reaction. For steady-state solutions, the model can be reduced to the ordinary differential equation

$$U''-\lambda u'+F(\lambda,u,\beta,u)=0$$
$$u''-\lambda u'+F(\lambda,u,\beta,u)=0$$

where

$$F(\lambda,\mu,\beta,u)=\lambda\mu(\beta-u)\exp(u)$$
$$F(\lambda,\mu,\beta,u)=\lambda\mu(\beta-u)\exp(u)$$

(The unknown *u* represents the steady-state temperature of the reaction, and the parameters λ, μ and β represent the Peclet number, the Damkohler number and the dimensionless adiabatic temperature rise respectively. This problem has been studied by various Authors who have demonstrated numerically the existence of solutions (sometimes multiple solutions) for particular parameter ranges.

1. Econamics: In [9], Z.D.Mitrovic' has used some results by S.Park [11] and derived a sufficient condition for existence of an equilibrium point in

the economic model of supply and demand for finite dimensional topological vector space. to any hyper convex space.

2. **Game theory:** We consider a game with $n \geq 2$ players, under the assumption that the players do not cooperate among themselves. Each players pursue a strategy, in dependence of the strategies of the other players. Denote the set of all

possible strategies of the kth player by K_k, and set $K = K_1 \times \cdots \times K_n$. An element $x \in K$ is called a strategy profile. For each k, let $f_k : K \to R$ be the loss function of the kth player. If

$$\sum_{k=1}^{n} f_k(x) = 0, \quad x \in K$$

the game is said to be of zero-sum. The aim of each player is to minimize his loss, or, equivalently, to maximize his gain.
